

Supporting Information

Table S1. Geographic differentiation among populations of *D. quinaria* from PA, NY, and ME. *COI* excludes sequences from flies carrying the mtDNA clade associated with *Wolbachia* infection. Included are two measures of genetic differentiation, K_{ST}^* (Hudson et al. 1992) and S_{nn} (Hudson 2000). Significance was determined using permutation tests, as implemented in DnaSP.

Locus	K_{ST}^*	S_{nn}
<i>COI</i>	0.0652 ($P < 0.0001$)	0.6274 ($P < 0.0001$)
<i>mof</i>	-0.0211 ($P = 0.805$)	0.3626 ($P = 0.248$)
<i>tpi</i>	0.058 ($P = 0.001$)	0.5948 ($P < 0.0001$)
<i>skpA</i>	0.0375 ($P = 0.076$)	0.3918 ($P = 0.092$)
<i>plexA</i>	0.1823 ($P = 0.21$)	0.5424 ($P = 0.145$)

Table S2. Polymorphism in *D. quinaria*. Each locus is separated by population and mtDNA clade. Included here is the number of sampled alleles (N), the total number of sites (L_{All}), the total silent sites (L_{Silent}), and the number of total (L_{All}), silent (S_{Silent}), and nonsynonymous (S_{Nonsyn}) segregating sites. Estimates of polymorphism are shown for all sites (π_{All}) and for silent sites only (π_{Silent}). Tajima's D (D), or the deviation from the site frequency spectrum, is calculated using silent sites only, with numbers in bold those that deviate from neutrality based on coalescent simulations ($P < 0.05$). Divergence for all loci except *RIB* is to *D. innubila*, another member of the quinaria group, and is for silent sites only (Divergence for *RIB* is to *D. palustris*).

Population/		Locus	mtDNA clade	N	L_{All}	L_{Silent}	S_{All}	S_{Silent}	S_{Nonsyn}	π_{All}	π_{Silent}	D_{Silent}	Div _{Silent}
